

SimpleRisk Release Notes

Version 20161023-001

This version includes a brand new User Interface, User Experience enhancements in the “Risk Management” section, and multiple bug fixes. If you are not already running SimpleRisk, then follow the standard installation instructions. If you are currently running the 20160612-001 release of SimpleRisk, then you will need to extract the new files over the old ones (back up your config.php first) and then run the /admin/upgrade.php script to upgrade your database.

The complete list of changes for this release is below:

- New Functionality
 - SimpleRisk will redirect the user, upon login, to the Register & Upgrade page if it hasn’t been registered yet.
 - Created functionality to dismiss the registration reminder.
- User Interface
 - New UI applied to the entire application.
 - New layout for risks, mitigations, and reviews.
 - Project management functionality combined into a single application.
- Code Cleanup
 - Added a better failed password message if the password being set does not meet the password policy.
 - Set the maxlength for the username field on the Add and Remove Users page to 200 characters.
- Bug Fixes
 - Fixed an issue where the closed risks value in the risk trend was not giving the correct number.
 - Fixed an issue where the link was not highlighted when the “II. Add & Delete Assets” link was selected under the “Asset Management” menu.
 - Fixed an issue where risks with a status of Closed may not have an entry in the closures table.
- Database Changes
 - Created a closure table entry for any risks that were closed and did not have one.
- Notes
 - As of the 20151219-001 release, we will no longer provide the SQL files for the various languages. Instead, users should use the Installer Script to perform their SimpleRisk MySQL database installation. If you would like to inspect the MySQL database schema before installing, the files can still be found under the “db” directory included with the Installer Script.

- In performing some testing with a newer version of PHP, it appears that PHP has removed the standard JSON extension as of PHP 5.5rc2 due to a license conflict. This functionality is used in SimpleRisk's graphing library. If you notice that your pie charts are not displaying properly, you may need to install the "php5-json" package for these charts to work as expected.
- A SimpleRisk user noted that they were having difficulty logging in with the default username of "admin" with password of "admin". Upon investigation, it was discovered that PHP was enforcing secure cookies, but the application was not using SSL, so the session values were not set. This may be an isolated instance, but if you experience this issue, try installing a SSL certificate and run SimpleRisk over HTTPS to fix it.
