

SimpleRisk Release Notes

Version 20161030-001

This version includes several security fixes for the 20161023-001 release and a fix for the new API functionality. If you are not already running SimpleRisk, then follow the standard installation instructions. If you are currently running the 20161023-001 release of SimpleRisk, then you will need to extract the new files over the old ones (back up your config.php first) and then run the /admin/upgrade.php script to upgrade your database.

The complete list of changes for this release is below:

- Code Cleanup
 - Fixed duplicate \$assessment and \$notes in edit_risk_details function.
- Bug Fixes
 - Fixed an issue with the .htaccess file for the SimpleRisk API.
- Security
 - Fixed Cross Site Scripting issues on the management index.php, view.php, mitigate.php, and mgmt_review.php pages.
- Notes
 - As of the 20151219-001 release, we will no longer provide the SQL files for the various languages. Instead, users should use the Installer Script to perform their SimpleRisk MySQL database installation. If you would like to inspect the MySQL database schema before installing, the files can still be found under the “db” directory included with the Installer Script.
 - In performing some testing with a newer version of PHP, it appears that PHP has removed the standard JSON extension as of PHP 5.5rc2 due to a license conflict. This functionality is used in SimpleRisk’s graphing library. If you notice that your pie charts are not displaying properly, you may need to install the “php5-json” package for these charts to work as expected.
 - A SimpleRisk user noted that they were having difficulty logging in with the default username of “admin” with password of “admin”. Upon investigation, it was discovered that PHP was enforcing secure cookies, but the application was not using SSL, so the session values were not set. This may be an isolated instance, but if you experience this issue, try installing a SSL certificate and run SimpleRisk over HTTPS to fix it.
